### **Watson Studio SPSS Modeler Overview**

#### Overview

In this lab you will learn how to implement machine learning in **SPSS Modeler**, a well-known visual data mining workbench which is part of **Watson Studio**. The lab will introduce the SPSS Modeler capability using the Titanic dataset. The lab will guide the development of an SPSS Modeler stream that will prepare the input data to train and evaluate a machine learning model for predicting survivability of a passenger on the Titanic.

#### Introduction

**SPSS Modeler** is a visual data mining workbench. Modeler can be used to complete all tasks in analytic application development

- Data understanding
- Data preparation
- Model building
- Model evaluation

Assets developed in Modeler are called "flows". Another frequently used term in Modeler documentation is "streams" (used in Modeler desktop documentation). A flow starts with one or several data sources. Using visual nodes, a user can apply different operations to data. Data "flows" from one node to another in the direction of the arrows.

Visual nodes in modeler are color-coded and organized by type of operation: **Record Operations, Field Operations, Graphs, Modeling, Output,** and **Export** (data sources). Most operations are well-known functions in data preparation and analytics, such as sampling, filtering, binning, etc.

The data sources are purple	custome
Data preparation operations are blue	⊗ >>> ○ Merge
Algorithms are green	D → Q CHURN
The models that are created based on algorithms are orange	⊙ <mark>}≎</mark> ○ CHURN
Different types of output (graphs, tables, external files) are black	TelcoCh
The nodes with a star icon are called "supernodes" because they contain several	Derive_A

nodes. Supernodes are used for visual organization of the flow.

If a user needs more information about a particular node, it can be looked up in Modeler documentation. SPSS also publishes the Algorithms Guide that explains how machine learning algorithms are implemented in Modeler.

### Lab Steps

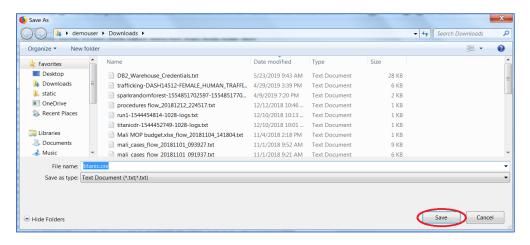

## Step 1: Adding a Data Asset to the Watson Studio Labs project

This step can be skipped if the titanic.csv file was already downloaded in a previous lab.

- 1. Download the Titanic data file from the following location by clicking here.
- 2. Right-click on the screen and click on Save Page As ...

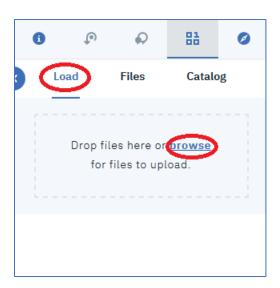

3. Click on **Save** to save the titanic.csv file.

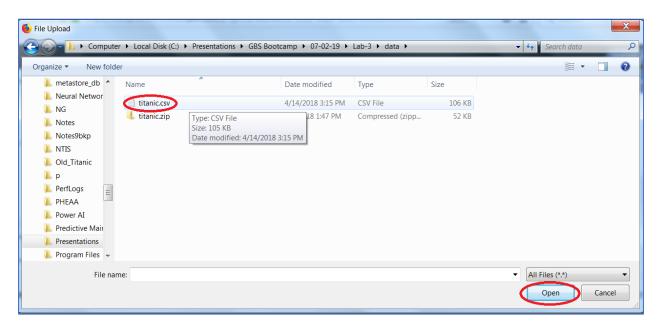

4. Go back to your Watson Studio Labs project. Click on the

5. Click on the **Load** tab and then click on **browse**. If you don't see the **Load** tab, click on the icon again.

6. Go to the folder where the titanic.csv file is stored. Select the titanic.csv file and then click **Open**.

7. The file is now added as a Data Asset.

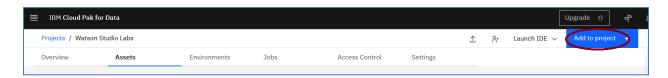

# Step 2: Create a Model to predict survival

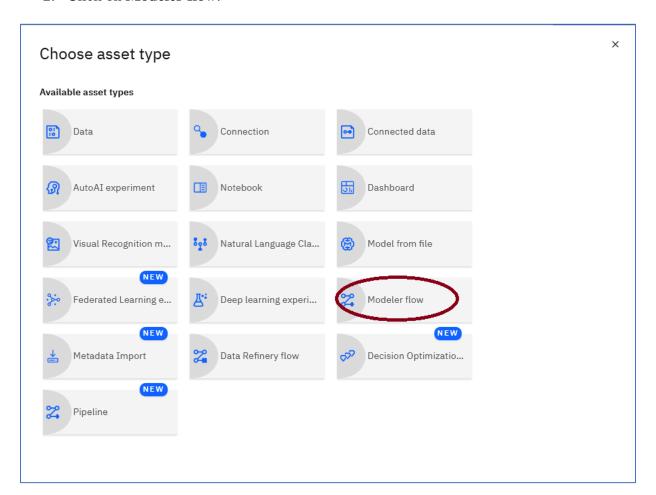

In this section, we will create a Machine Learning flow using SPSS nodes.

## Step 2.1 Create a New Flow and Load the Data

1. In the Watson Studio project, click on Add to project.

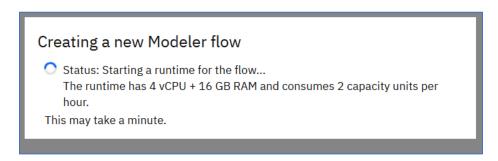

2. Click on Modeler flow.

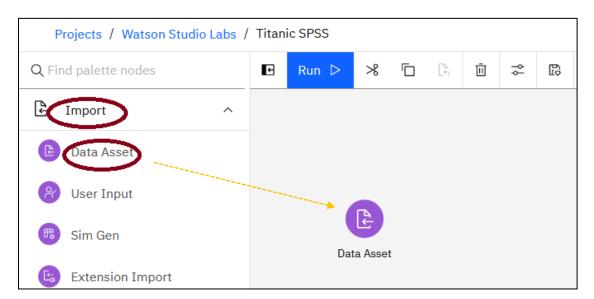

3. Enter a **Name** for the flow, optionally enter a **Description**, leave the switch the **Environment definition** to **4 vCPU 16 GB RAM** and click on **Create**.

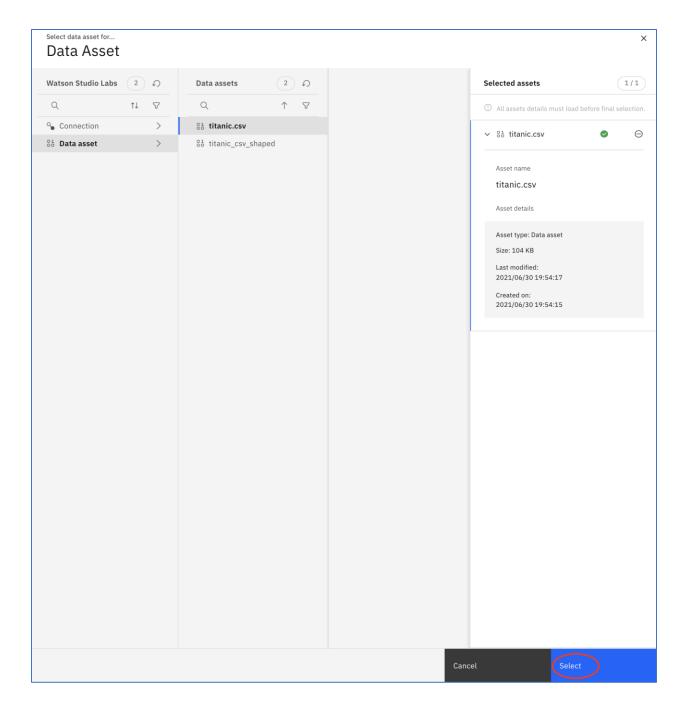

4. A status message will appear. Please wait until the Flow Editor opens.

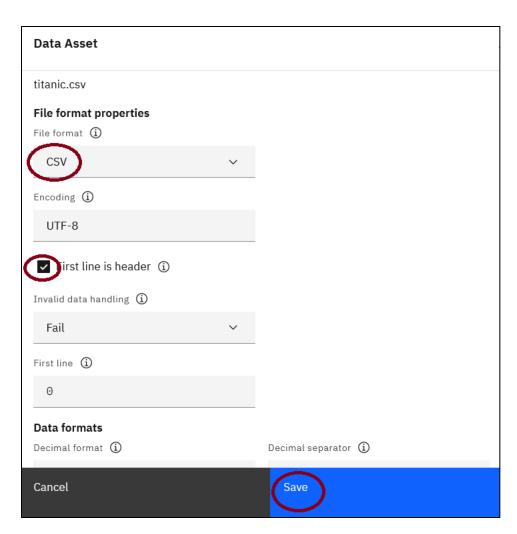

5. Click on **Import** and then **Data Asset** and hold the left mouse key on the Data Asset icon and **drag it onto the left side of the canvas**. Release the left mouse key.

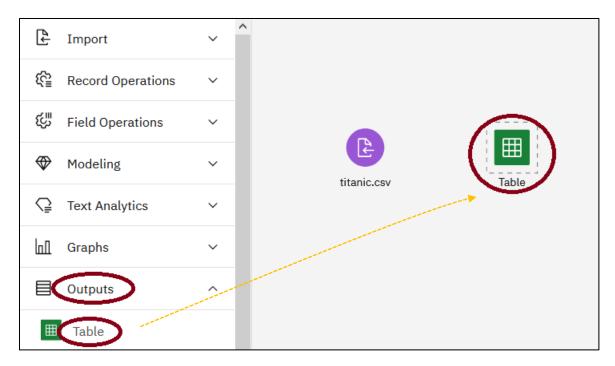

6. Double click on the **Data Asset**. Click on **Data assets**, **titanic.csv** and click **Select**.

7. Set File format to CSV, click on the first line is header check box. Click Save.

8. Click on the **Outputs** menu item in the Node Palette on the left and then click on the **Table** icon and drag the icon to the right of the titanic.csv icon. The SPSS Table node will display the contents of the csv file. If the Node Palette is not visible, click on the Node Palette icon .

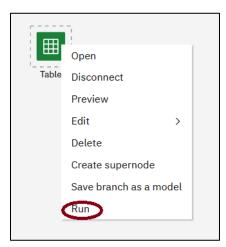

9. Connect the right side of the titanic.csv icon to the left side of the Table icon. This is accomplished by hovering the mouse over the titanic.csv icon, clicking on the arrow at the right side of the titanic.csv icon, holding the left mouse key and dragging the arrow until Table icon becomes active (dashed lines around it), and then releasing the left mouse key.

10. Right click on the **Table** icon and select **Run**.

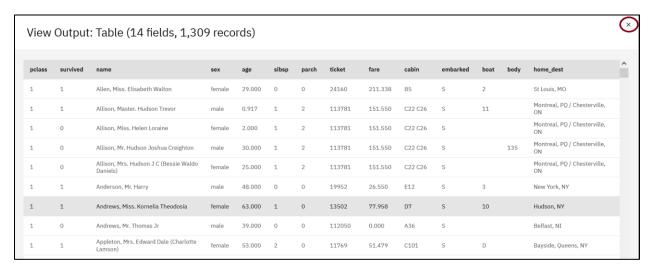

11. The "Running Flow" prompt will appear and then when completed a Table output selection will appear on the right side of the screen under the **Outputs** tab. If the Table

output selection does not appear, select the selection to view the titanic csy contents.

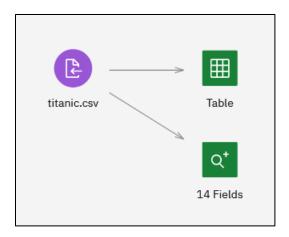

12. Each row contains information on a passenger on the Titanic. We will use this data to make predictions on survivability. Return to the SPSS canvas by clicking on the **x** (close) icon.

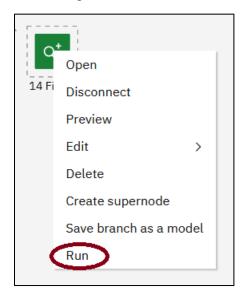

Step 2.2 Explore the Data using the Data Audit Node

Perusing through the data in the table, we can see that there are missing values. The SPSS Modeler has a Data Audit node that provides profiling information on the input data that is useful for cleansing the data. It provides a comprehensive first look at the data, including summary statistics, as well as information about outliers, missing values, and extremes.

1. Add a **Data Audit** node to the flow by clicking on the **Outputs** menu item in the Node Palette, and then dragging the **Data Audit** node to underneath the Table node. If the Node Palette is not visible, click on the Node Palette icon . Connect the titanic.csv node to the Data Audit node. The canvas should appear as below.

2. Right click on the Data Audit node and click Run.

3. The "Running Flow" prompt will appear and then when completed a Data Audit output selection will appear on the right side of the screen under the **Outputs** tab. If the **Outputs** 

U

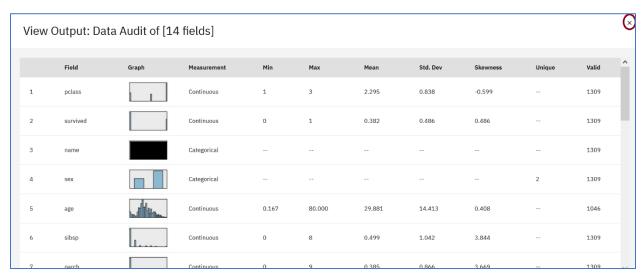

tab doesn't display, click on the selection.

icon. Click on the  $\boldsymbol{Data}$   $\boldsymbol{Audit}$  output

4. We can see that several fields have many missing values (cabin, boat,body,home\_dest. These fields will be removed using a **Filter** node below. Other fields have only a few missing values (fare, embarked). Age has over 260 missing values (showing only 1046

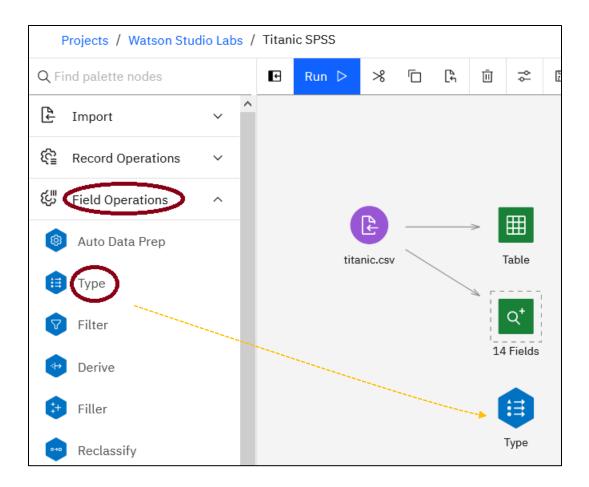

valid values out of 1309). The rows containing the missing values for fare, embarked, and age will be removed using a **Select** node below. Return to the SPSS canvas by clicking on the  $\mathbf{x}$  (close) icon.

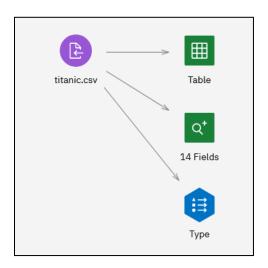

**Step 2.3 Explore the Data using Graph Nodes.** 

Let's explore the data using Graph Nodes. The Distribution node, and the Histogram node will be used to explore some of the characteristics of the Titanic Data Set. First, we will add a Type node to the canvas. The Type node specifies field metadata and properties. We will change the measurement property for the "pclass" and "survived fields" that was derived as "Continuous" (by scanning the data values) to "Ordinal" and "Flag" respectively.

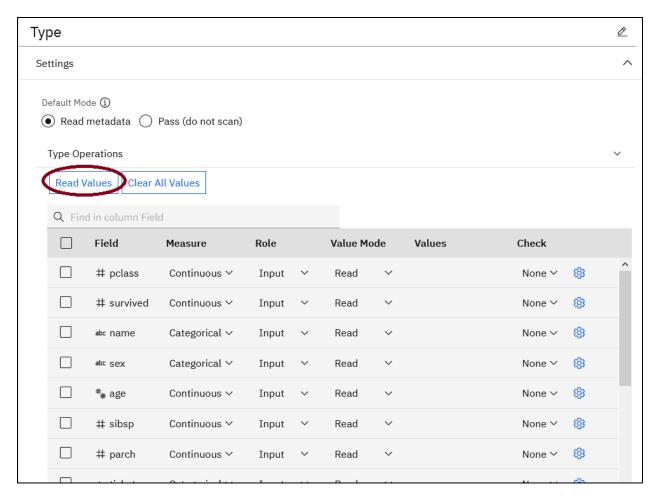

1. Add a **Type** node to the flow by clicking on the **Field Operations** menu item in the Node Palette and then drag the **Type** node underneath the **Data Audit** node. If the Node Palette is not visible, click on the Node Palette icon

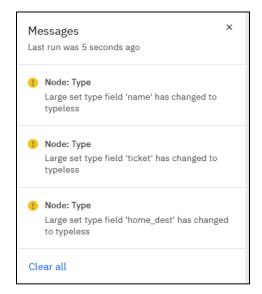

2. Connect the titanic.csv node to the **Type** node. The canvas should appear as below.

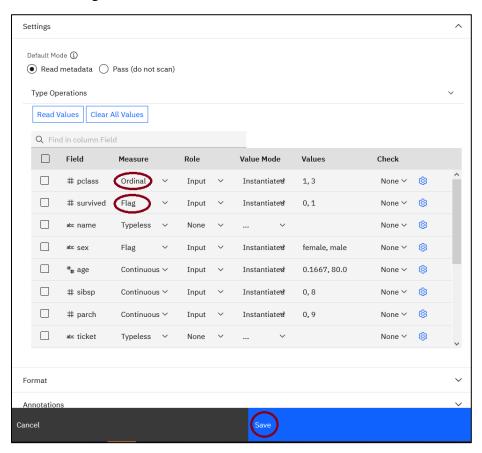

3. Double click on the **Type** node. This will open a **Type** menu panel on the right side of the screen. Click on **Read Values**.

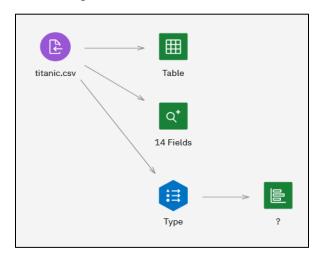

4. Certain fields are changed to a Typeless measure due to the number of unique values in the field. If there are a large number of unique values, the field is not useful for modeling.

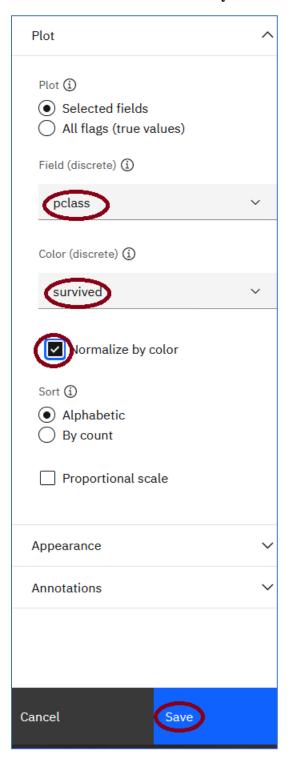

5. Select the dropdown in the **Measure** column next to **Survived**. Change the **Measure** from **Continuous** to **Flag**. Select the dropdown in the **Measure** column next to **pclass**. Change the measure from **Continuous** to **Ordinal**. Click **Save**.

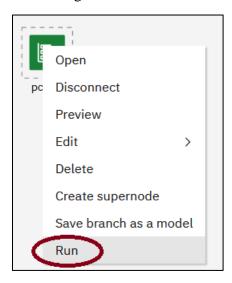

6. Add a **Distribution** node to the flow by clicking on the **Graph** menu item and then dragging the **Distribution** node to the canvas to the right of the **Type** node. If the Node Palette is not visible, click on the Node Palette icon • Connect the **Type** node to the **Distribution** node. The canvas should appear as below. The ? indicates that the fields to be plotted have not been identified.

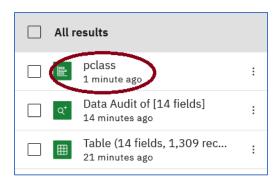

7. Double click on the Distribution Node. Click on the **Plot** dropdown. In the **Field** (**discrete**) dropdown, select **pclass**. In the Color (discrete) dropdown, select **survived**. Click on the **normalize by color** checkbox, and then click **Save**.

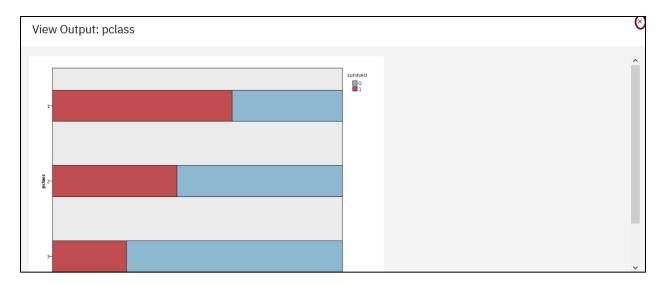

8. Right click on the Distribution node and select **Run**.

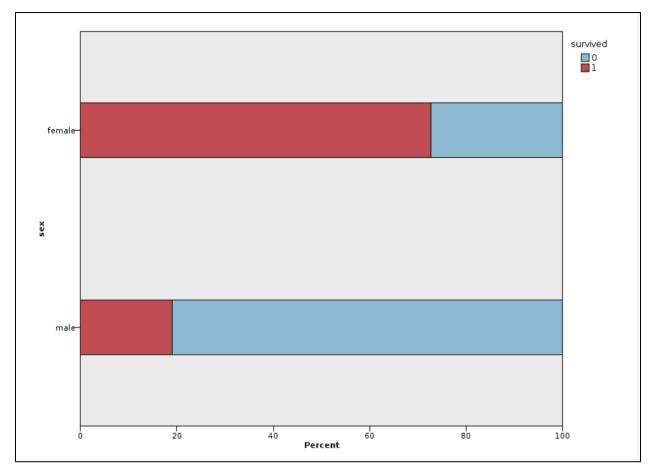

9. The Distribution of pclass will appear under the **Outputs** tab. Click on the **pclass** output selection.

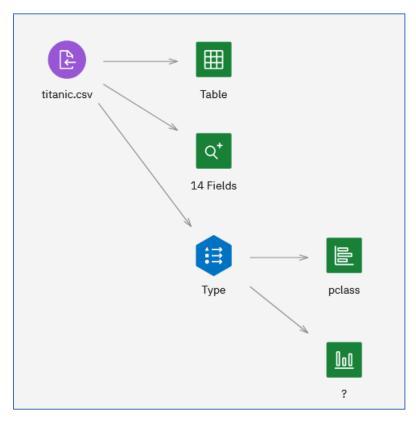

10. We can see from the graph that the likelihood of surviving is correlated to the passenger class. The first-class passengers have the highest rate of survivability. **Note if you see a graph with green bars, instead of the one below, redo Steps 9-11.** Return to the SPSS canvas by clicking on **x** (close) icon.

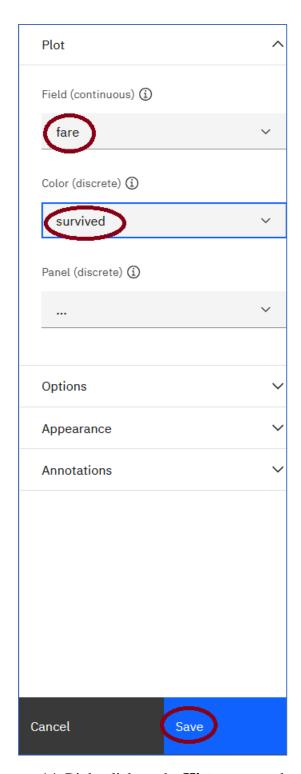

11. You can change the distribution graph to show the survivability by gender by double clicking on the Distribution node and replacing **pclass** with **sex** and clicking **Save**. Re-run the graph by right clicking on the Distribution node and selecting **Run**. Click on the **sex** output selection to display the graph. Once you have seen the results, close the view by clicking on the **x** icon.

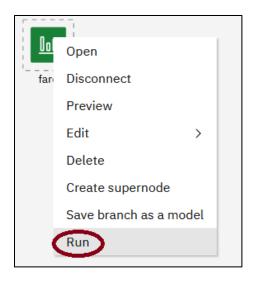

12. Add a **Histogram** node to the flow by clicking on the **Graphs** menu item and then dragging the **Histogram** node to the canvas underneath the **Distribution** node. If the Node Palette is not visible, click on the Node Palette icon . Connect the **Type** node to the **Histogram** node. The canvas should appear as below. The ? indicates that the fields to be plotted have not been identified.

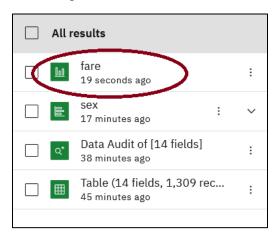

13. Double click on the **Histogram** node. Click on the **Plot** dropdown. Select **fare** from the Field (continuous) dropdown. Select **survived** from the Color (discrete) dropdown. Click on **Save**.

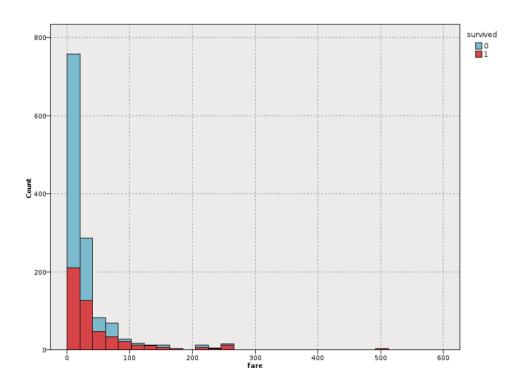

14. Right click on the  ${\bf Histogram}$  node and select  ${\bf Run}.$ 

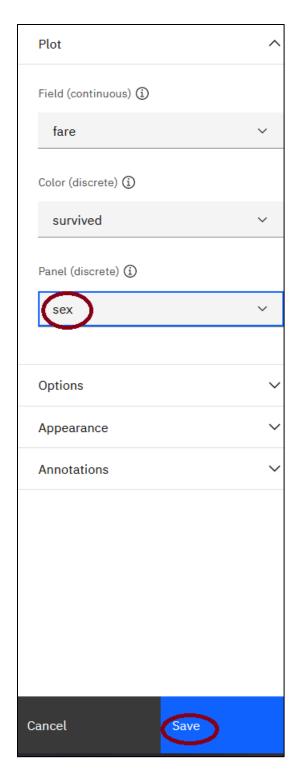

15. Click on the **fare** output selection next to the fare Histogram under the Outputs tab at the right of the screen.

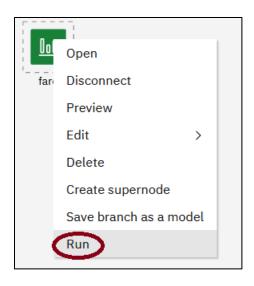

16. We can see that the higher fares have a higher percentage of survival. We can also see that the histogram is skewed. Skewness will impact the effectiveness of some machine learning techniques. One way to deal with skewness is to do a logarithmic transformation of the data. We will do this transformation in the preparing the data for modeling section below.

17. You can view the above graph separately for male and female passengers. Return to the SPSS canvas by clicking on **x** (close) icon. DoubleClick the Histogram icon. In the **Panel** (**discrete**) select sex, and the click **Save**.

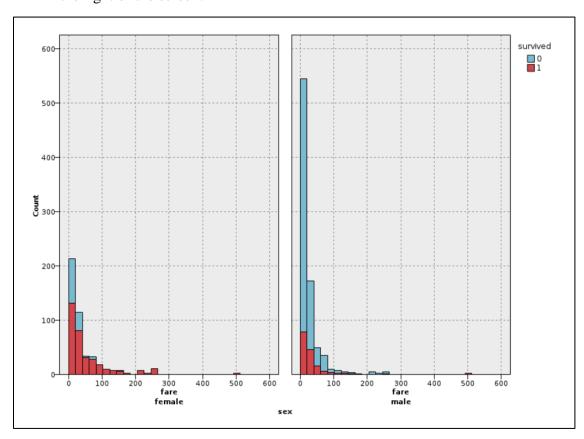

18. Right click on the Histogram and select  ${\bf Run}$ .

19. Click on the fare output selection the right of the screen.

under the Outputs tab at

20. Return to the SPSS canvas by clicking on x (close) icon.

**Step 2.4 Prepare the Data for Modeling** 

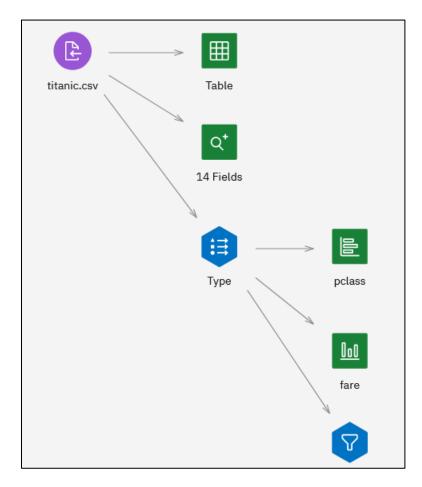

Based on our exploration of the data, there are several transformations that are needed to prepare the data for modeling. This section will introduce, the **Filter** node, the **Select** node, and the **Derive** node that will do the necessary transformations. The **Filter** and **Derive** nodes act on a field level, whereas the **Select** node acts on a record level.

**Filter** node – The **Filter** node performs two functions. It specifies fields that can be dropped. It also allows fields to be renamed. We will drop the fields cabin,boat,body, and home\_dest.

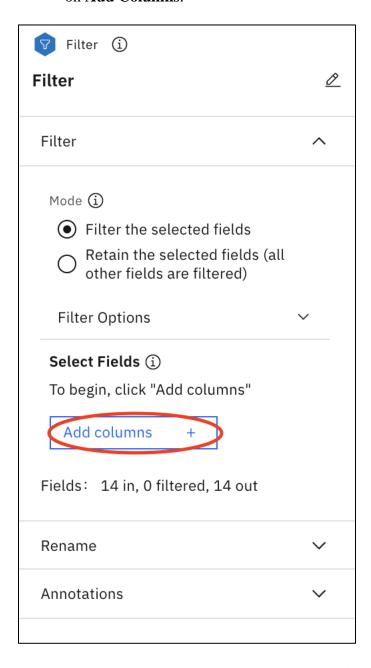

**Derive** node – The **Derive** node modifies data values or creates new fields from one or more existing fields. We will use the derive node to do a logarithmic transformation of the fare field. We will also use this node to bin the age and fare fields.

**Select** node – The **Select** node is used to select or discard a subset of records from the data stream based on a specific condition. We will remove the rows where there is missing information in the fare, age, or embarked fields.

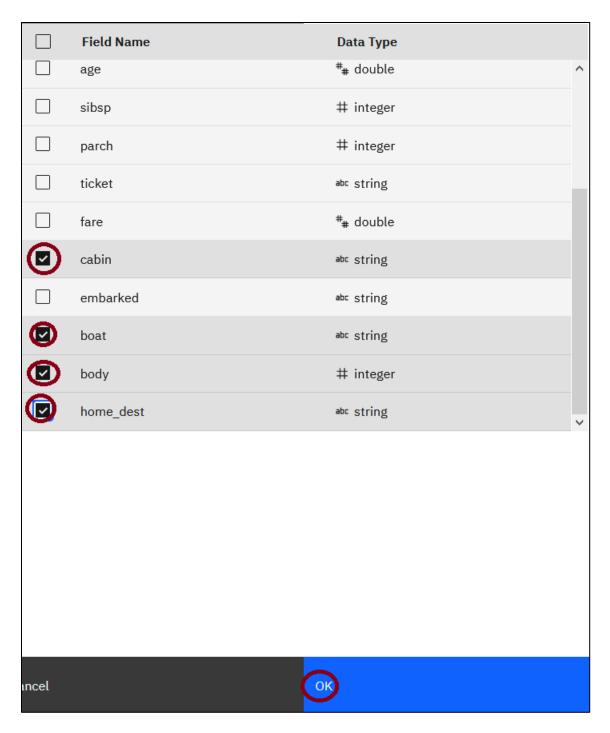

1. Add a **Filter** node to drop fields with many missing values. Add the **Filter** node by clicking on the **Field Operations** menu item in the Node palette and dragging the **Filter** node onto the canvas underneath the fare **Histogram** node. If the Node Palette is not visible, click on the Node Palette icon first. Connect the **Type** node to the **Filter** node. The canvas should appear as below.

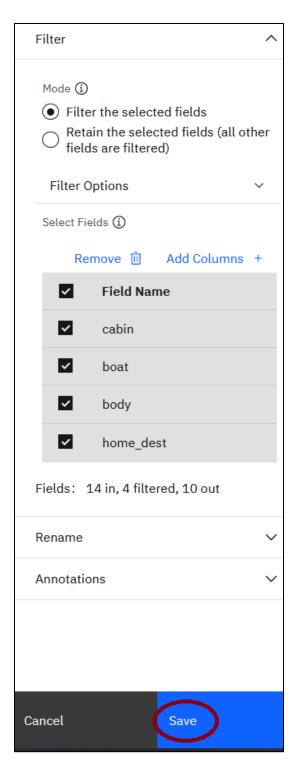

2. Double click on the **Filter** node. Click on the **Filter** dropdown. In the Filter panel, click on **Add Columns**.

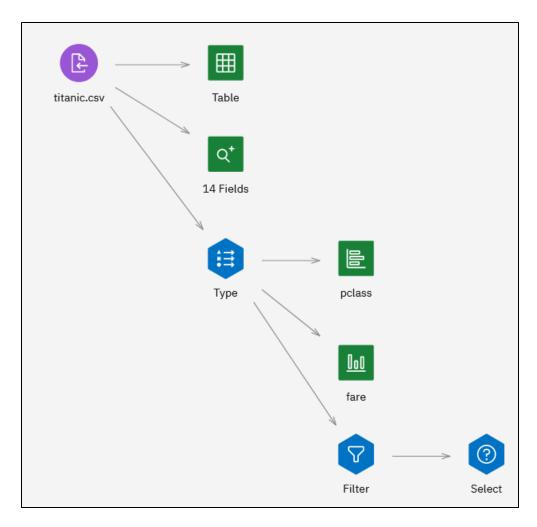

3. Click on the checkboxes adjacent to the **cabin**, **boat**, **body**, and **home\_dest** fields, and then click on **OK**. Scroll down if necessary to locate these fields.

4. Click **Save** on the Filter panel.

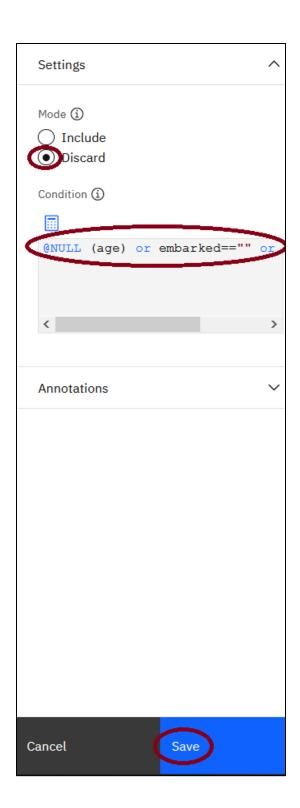

5. Add a **Select** node by clicking on the **Record Operations** menu item in the Node palette, and then dragging the **Select** node to the canvas to the right of the **Filter** node. Connect the **Filter** node to the **Select** node. If the Node Palette is not visible, click on the Node Palette icon first. The canvas should appear as below.

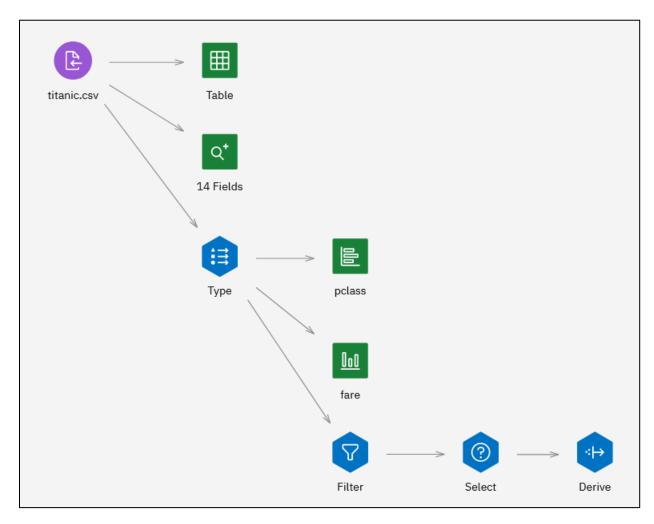

6. Double click on the **Select** node. Click on the **Settings** dropdown. In the **Select** panel, click on the **Discard** radio button, copy and paste (or type) the code shown below in the **Condition text box**, and then click **Save**.

@NULL (age) or embarked=="" or @NULL(fare)

7. Add a **Derive** node to the canvas by clicking on the **Field Operations** menu item in the Node palette, and then dragging the **Derive node** onto the canvas to the right of the **Select** node. If the Node Palette is not visible, click on the Node Palette icon first. Connect the **Select** node to the **Derive** node. The canvas should appear as below.

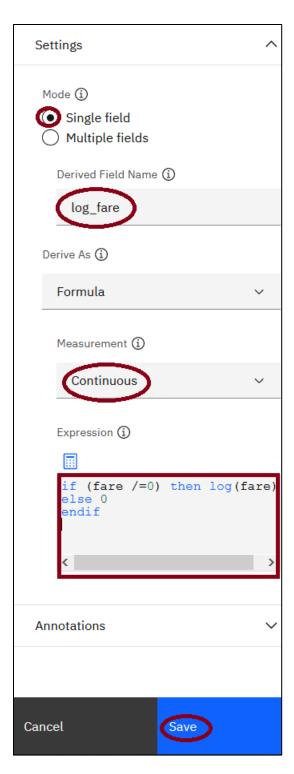

8. Double click on the **Derive** node. Click on the **Settings** Dropdown. Click on the **Single** radio button, enter log\_fare for the **Derive** field, select **Continuous** for the measurement, copy and paste (or type) the following code in the **Expression** text box, and click Save.

if (fare  $\neq 0$ ) then log(fare)

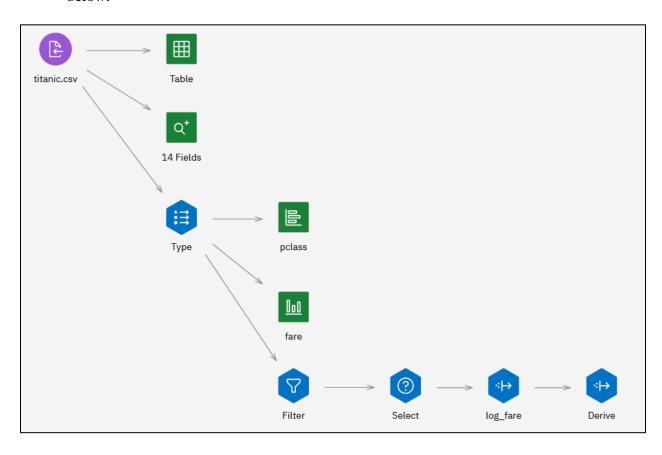

else 0

endif

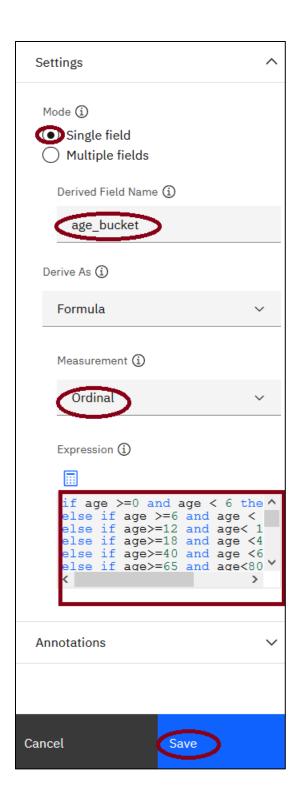

9. Binning of continuous fields is a technique sometimes used in preparing data for modeling. We will bin the age field, and the log\_fare field. Add a **Derive** node by clicking on the **Field Operations** menu item in the Node palette and dragging the **Derive** node on the canvas to the right of the log\_fare **Derive** node.

If the Node Palette is not visible, click on the Node Palette icon first. Connect the log\_fare **Derive** node to the newly added **Derive** node. The canvas should appear as below.

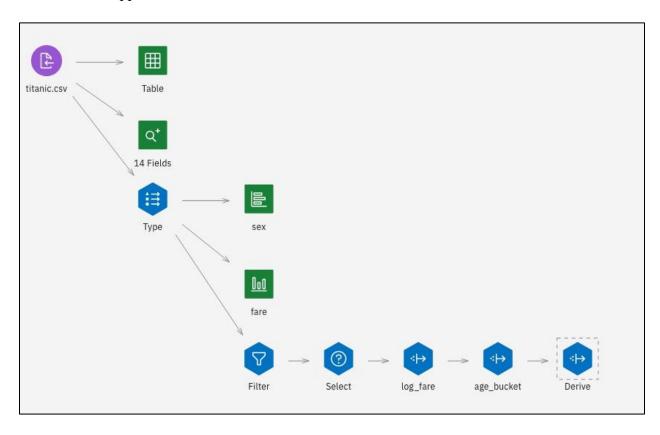

10. Double click on the **Derive** node. Click on the **Settings** dropdown. Click on the **Single** radio button, enter age\_bucket for the **Derive** field, select **Ordinal** for the **Measurement**, copy and paste the following code in the **Expression** text box, and then click **Save**.

```
if age >=0 and age < 6 then 0
else if age >=6 and age < 12 then 1
else if age>=12 and age< 18 then 2
else if age>=18 and age <40 then 3
else if age>=40 and age <65 then 4
else if age>=65 and age<80 then 5
else 6
endif
endif
endif
endif
endif
endif
endif
endif
endif
```

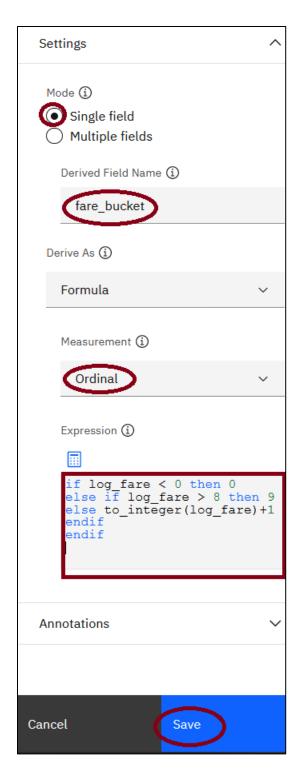

11. Add a **Derive** node by clicking on the Field Operations menu item in the Node palette and dragging the **Derive** node onto the canvas to the right of the age\_bucket **Derive** node. You can click on the **zoom to fit** icon in the top right to fit the flow to the canvas.

Connect the age\_bucket **Derive** node to the newly created **Derive** Node. The canvas should appear as below.

12. Double click the **Derive** node. In the **Derive** panel, click on the **Single** radio button, enter fare\_bucket in the **Derive** field, click on Ordinal for the **Measurement**, copy and paste (or type) the following code in the **Expression** text box, and click on **Save**.

```
if log_fare < 0 then 0
else if log_fare > 8 then 9
else to_integer(log_fare)+1
endif
endif
```

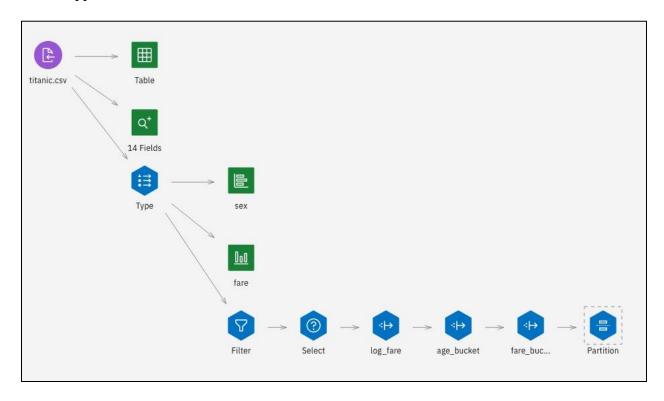

**Step 2.5 Modeling and Evaluation** 

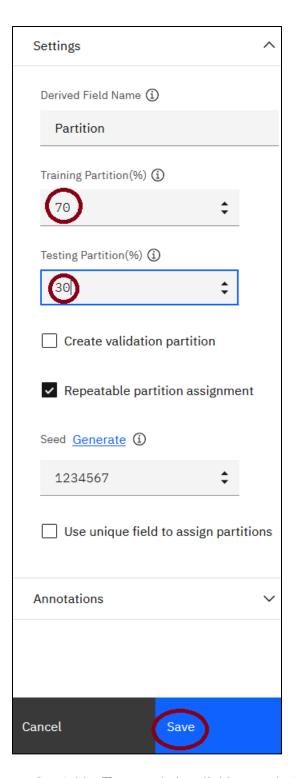

Now that the data is prepared, we can start the modeling effort. First, we will add a **Partition** node to divide the data set into Training and Testing sets. In addition, a **Type** node is needed prior to modeling to type the new data fields that were created. Then we will add a **Logistic** node

and use the Training set to train the model. Finally, we will add an **Analysis** node to evaluate the results.

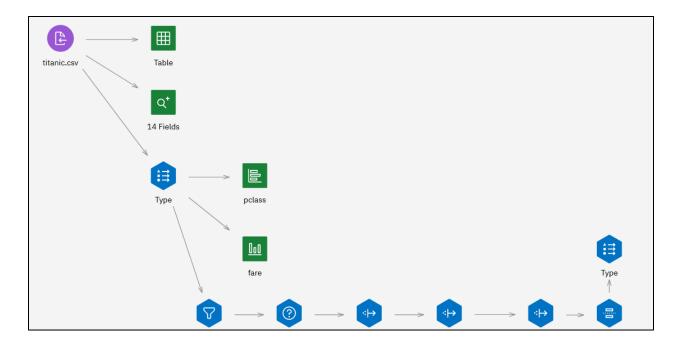

1. Add a **Partition** node by clicking on the Field Operations menu item in the Node palette and dragging the **Partition** node onto the canvas to the right of the fare\_bucket **Derive** node. Connect the fare\_bucket **Derive** node to the **Partition** node. The canvas should appear as below.

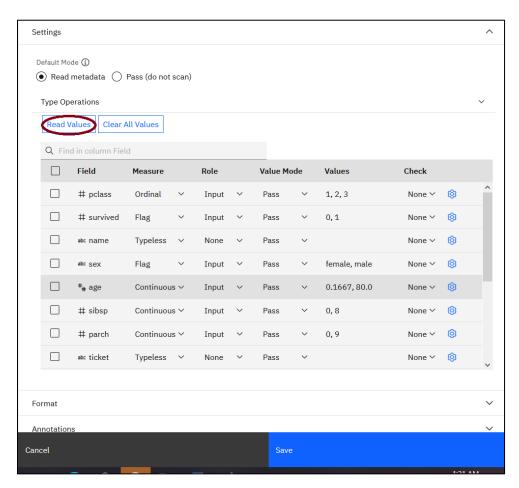

2. Double click on the Partition node. Set the **Training Partition** to 70 and the **Test Partition** to 30. Leave the other defaults and click on **Save**.

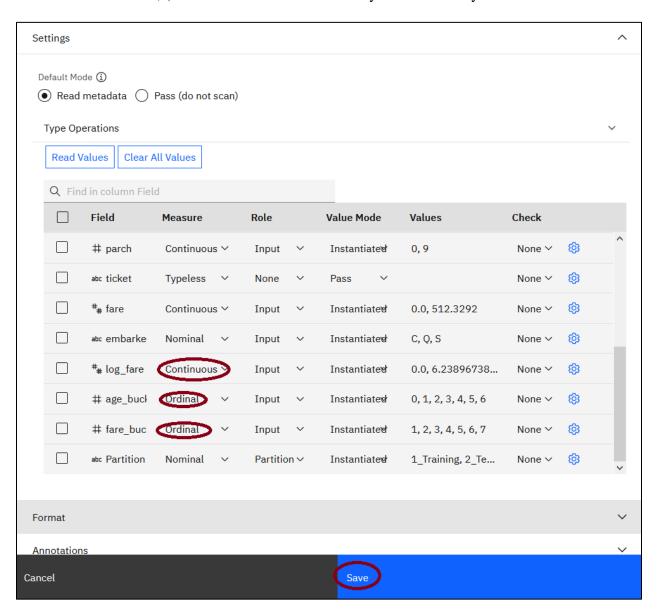

3. Add a **Type** node by clicking on the **Field Operations** in the Node palette and dragging the **Type** node onto the canvas above the **Partition** node. Connect the **Partition** node to the **Type** node. The canvas should appear as below.

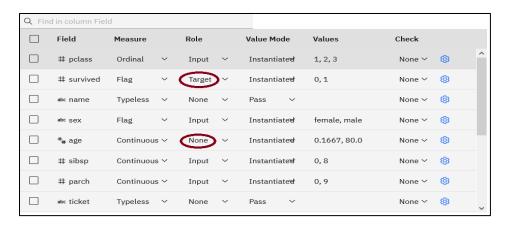

4. Double click on the **Type** node. Click on **Read Values**.

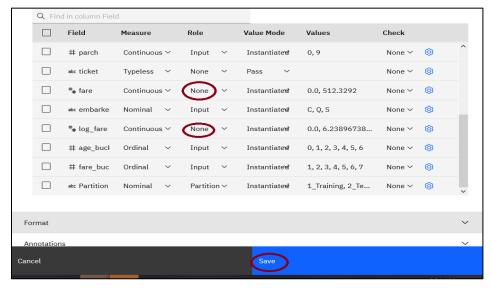

5. For the log\_fare, select **Continuous** for the **Measurement**. For the fare\_bucket field, select **Ordinal** for the **Measurement**, and for the age\_bucket, select **Ordinal** for the **Measurement**, (note these values should already be set correctly.

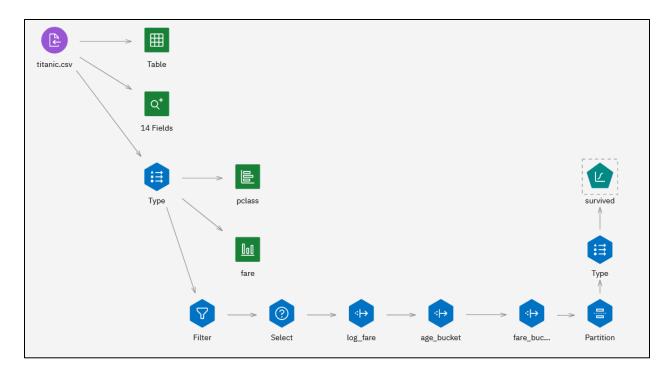

6. Update the **Role** of the following **Fields:** survived → Target, age → None, fare → None, log\_fare → None and click **Save**.

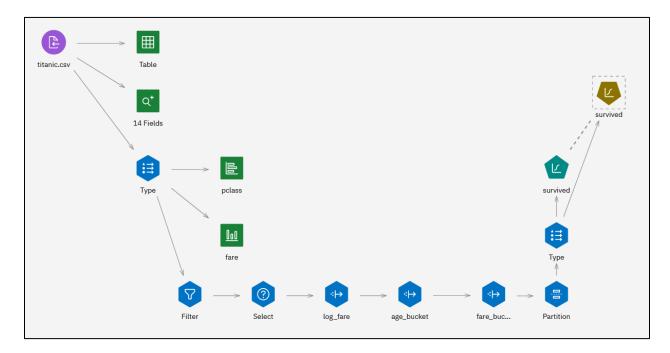

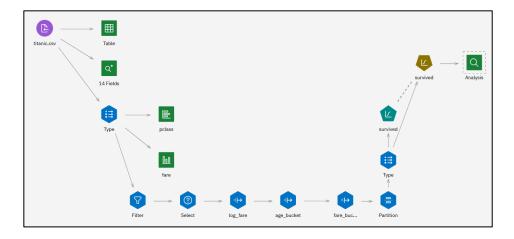

7. Add a **Logistic** node by clicking on the **Modeling** menu item in the Node palette and dragging the **Logistic** node onto the canvas above the **Type** node. Connect the **Type** node to the **Logistic** node. The canvas should appear as below.

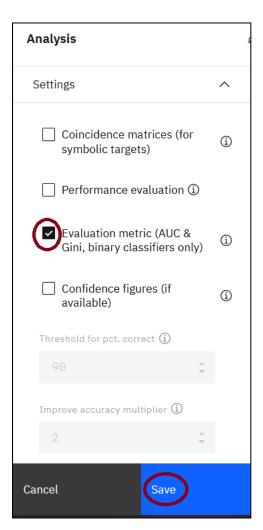

8. Right click on the **Logistic** node and then click **Run**. A **Logistic** "nugget will be created" connected by a dotted line to the **Logistic** node. Note, it may be hidden under another node. Drag the nugget and place it above the **Logistic** node. The canvas should appear as below.

9. Add an **Analysis** node by clicking on the **Outputs** menu item in the Node palette and dragging the **Analysis** node onto the canvas above the nugget icon. Connect the nugget icon to the **Analysis** node. The canvas should appear as below.

10. Double click on the Analysis node. Click on the **Settings** dropdown. Click on the **Evaluation metric** checkbox and click on **Save**.

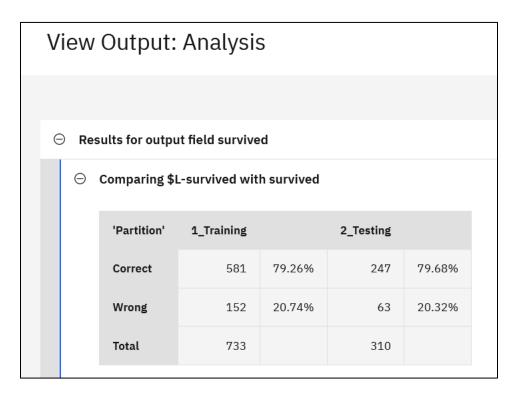

11. Right click on the Analysis node and select Run. After completion, click on the

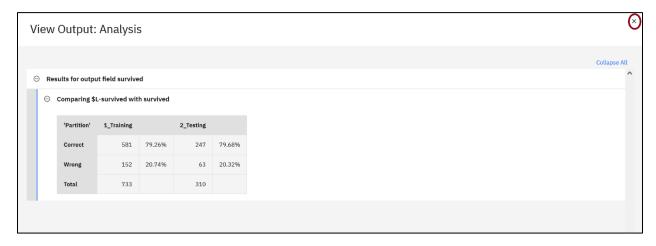

Analysis output selection

Analysis output selection

Analysis in the Outputs tab on the right side of the screen. The results should be similar to those shown below.

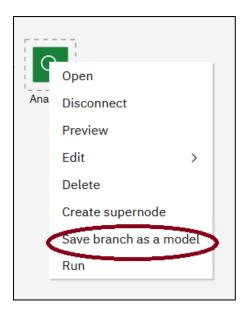

12. Click on the **x** to return to the flow.

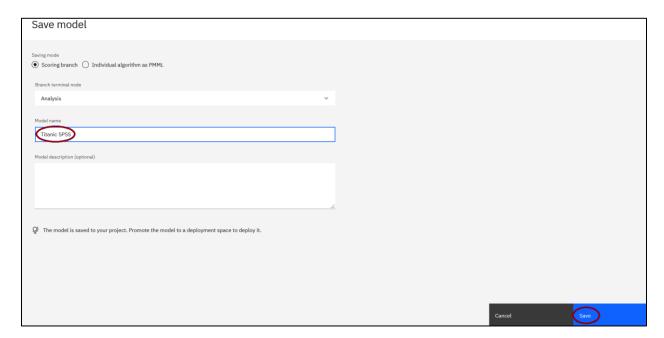

## **Step 2.6 Saving a Model**

Now that we have created and evaluated a model, we will save the model as an asset. This saved model can be deployed at a future date, removing the need to recreate the same model from scratch.

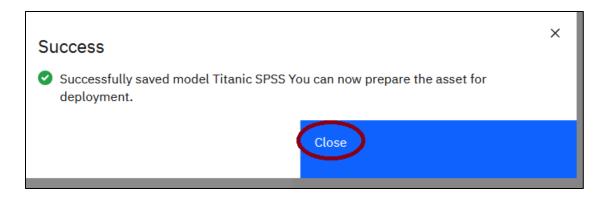

1. Right click on the Analysis node and then click on **Save branch as a model**.

2. Type in "Titanic SPSS" as the Model Name and click Save.

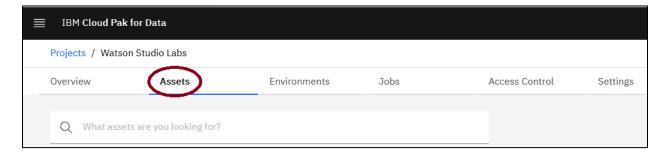

3. Click Close.

4. Click on Watson Studio Labs to return to the Project.

5. Click on the Assets tab if necessary.

6. Note that the model you built is now saved as an asset and the work you have completed can be easily reused in the future.

#### You have completed the Lab!!!

- ✓ Became familiar with the Watson Studio SPSS Modeler capability
- ✓ Audited the Titanic data set
- ✓ Explored the Titanic data set with visualizations

- ✓ Cleansed and Transformed the data
  ✓ Trained and Evaluated a machine learning mode.
  ✓ Saved the model
